

ABSTRACT

In an apparatus for interfacing a line for conveying articles (4a) with a feeding line having a different pitch, a plurality of carriages carrying seats or trays for the articles, are driven by conveying chains having a plurality of pins which engage with corresponding recesses made in the carriages, in a first area of the apparatus. Flat projection joined to vertical walls support and guide the carriages in the forward movement direction while the chains are supported and guided by the walls. A worm screw drives the carriages in the forward movement direction, in a second area of the apparatus; Rollers are provided in the bottom of the carriages for mutual removable coupling with the worm screw, in the second area of the apparatus.
